

The 29th Conference of the World Association for the Advancement of Veterinary Parasitology was a splendid scientific event, both in terms of high level of organization and of its varied program. I thoroughly enjoyed my short time in Chennai and I benefitted a lot from all of the sessions that I attended. For these reasons, I want to express my big gratitude to WAAVP African Foundation for the travel scholarship in order to make easy my participation. The African foundation helped me get one step closer to my future success in parasitology. The WAAVP conference has long been the medium of scientific exchange, inspiration and collaboration in veterinary research. This outstanding conference helped me build professional connections with parasitologists across the world that provides avenues for collaborations in the future. The given presentations were indisputably an excellent opportunity for me to learn about the latest research findings and advances in veterinary parasitology. For my research line in anthelmintic resistance, my participation in WAAVP conference offered me a forum for presenting my findings in the context of studies related to alternative molecules for the control of anthelmintic resistance in livestock and receiving feedback from peers and experts working in drug resistance.
